Final Project Report

The problem that this application solves is to provide things for a person to do when they are bored. The goal was to list places for users to find that are nearby in a very *direct* way. There are many applications out there that solve this problem such as Yelp and Google Places, but it is not as direct as this application. This app could have been built as a native mobile application, but it would provide no added benefit. Implementing it as a website is the most efficient way for a user to access it.
